

THC Potency

Old school marijuana (before you were born) contained between 2-5% THC. Today's marijuana has been cultivated to be much stronger, between 15-30% and even more (it's like smoking several old school joints one time).

Old school marijuana used to contain equal amounts of CBD, which was a protective factor. Today's marijuana contains almost no CBD, just THC.

Then chemists invented new marijuana products that didn't exist in the past. Raw THC is extracted marijuana using a machine (like the one on this page) and turned into concentrates. These products, such as wax, shatter, and crystal ("dabs"), can be 60-99% pure THC.

Extracted THC can be further distilled into oils, which are 80-99% pure. These oils can be vaped or put into edibles. Marijuana might start as a plant, but these products are created in a lab, and there's nothing natural about them!

Marijuana is a very different drug than it used to be—it's like comparing apples and oranges. Many plants aren't safe and can hurt you, such as poison ivy, arsenic, hemlock, and marijuana, which is why we don't mess with them.

THC percentages are based on samples seized by the DEA and current marijuana products available in dispensaries.

Many people think marijuana is safe, but there are real risks.

FACT:

ALL marijuana products today, whether flower, dabs, vapes, or edibles are **HIGH POTENCY** (defined by the medical field as anything over 10%) and **UNSAFE**. There are **NO** studies that indicate today's high-potency marijuana products are healthy for youth.

QUESTIONS: All the research done on youth marijuana use has proven it's harmful, and no studies of today's high-potency marijuana have shown any benefit for youth. Does this worry you? Are you willing to roll the dice with your brain and your future?
